The cosmic microwave background (CMB, CMBR) is electromagnetic radiation as a remnant from an early stage of the universe in Big Bang cosmology. In older literature, the CMB is also variously known as cosmic microwave background radiation (CMBR) or "relic radiation". The CMB is a faint cosmic background radiation filling all space that is an important source of data on the early universe ...

The discovery of cosmic microwave background radiation constitutes a major development in modern physical cosmology. The cosmic background radiation was measured by Andrew McKellar in 1941 at an effective temperature of 2.3 K using CN stellar absorption lines observed by W. S. Adams. Theoretical work around 1950 showed that the need for a CMB for consistency with the simplest relativistic ...

Here's a hint. This first photograph of the mystery phenomenon is presented with the same angular resolution as the camera on the COBE satellite: Cosmic Background Explorer's Differential Microwave Radiometer (COBE-DMR). (Angular Resolution simply means how much detail is in an image. A camera with more megapixels has a greater angular resolution; more resolution = more information.)

Microwaves are non-ionizing radiation, so they do not have the same risks as x-rays or other types of ionizing radiation. But, microwave radiation can heat body tissues the same way it heats food.

Researchers working at the South Pole Telescope (SPT) have detected tiny fluctuations known as B-mode polarization in cosmic background radiation.

Radiation, also commonly referred to as electromagnetic radiation (EMR), electromagnetic chaos (EMC), and electromagnetic frequencies (EMF), is not a simple topic to discuss.

Light from the Big Bang! Penzias and Wilson discover the Cosmic Microwave Background, the remnant radiation from the very early universe, which makes the case for the Big Bang Theory.
