In organic chemistry, an imide is a functional group consisting of two acyl groups bound to nitrogen. The compounds are structurally related to acid anhydrides, although imides are more resistant toward hydrolysis. In terms of commercial applications, imides are best known as components of high-strength polymers, called polyimides

Seeing old friends in a new light: A divergent synthesis of quinine and quinidine (see structures) was designed on the basis of a symmetrical and nonstereogenic intermediate, conceptually different from the stereodefined piperidine precursors used in past syntheses. Complementary late-stage local-desymmetrization reactions were developed to access the two targets.
