Evolution is change in the heritable characteristics of biological populations over successive generations. These characteristics are the expressions of genes that are passed on from parent to offspring during reproduction. Different characteristics tend to exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

Biology is the natural science that studies life and living organisms, including their physical structure, chemical processes, molecular interactions, physiological mechanisms, development and evolution. Despite the complexity of the science, there are certain unifying concepts that consolidate it into a single, coherent field. Biology recognizes the cell as the basic unit of life, genes as ...

Life is Organization Seen in retrospect, evolution as a whole doubtless had a general direction, from simple to complex, from dependence on to relative independence of the environment, to greater and greater autonomy of individuals, greater and greater development of sense organs and nervous systems conveying and processing information about the state of the organism's surroundings, and ...

Understanding Evolution: History, Theory, Evidence, and

Neo-Darwinism can rebut this line of criticism in two ways: 1) almost any gene will work – a "many-worlds" theory of biology, or; 2) there is an easily-found mutational pathway, as Manfred Eigen described in 1987, leading from the first set of primitive genes to all of the genes subsequently used in biology. But, since 1987, Eigen's model has not been fleshed out.
